Estate Of Marcia Joy Palmer 17130 26th Ave SE Bothell, WA 98012

Per the seller, the following items listed on the pre-sale inspection summary dated 05/29/2023 are being corrected by the seller as part of preparation for sale in good faith.

The following items have been completed as of 05/31/2023

Switch plate cover on garage Outlets replaced
Power to Outlets in Primary Bedroom restored
Clothes Washer in Garage Serviced
Orkin Pest Control verified droppings in Attic are old and not recent activity
Verified SPA feature of tub works when plugged in

The following items will be corrected by Seller prior to Closing

Repair Pilot light for Fireplace
Repair sheetrock penetrations into the attic or living areas from the Garage
Repair Loose Toilet
Trim branches away from roof
Paint boards that are missing paint above the roof line

May 30, 2023

Mr. Justin Stobb 17130 26th Avenue SE Bothell, WA.

Re: 17130 26th Avenue SE

Bothell, WA.

Dear Justin;

At your request, a visual inspection of the above referenced property was conducted on 05/29/2023. We have inspected the major structural components, plumbing, heating and electrical systems for signs of significant non-performance, excessive or unusual wear and general state of repair.

Clark Inspections inspectors, inspect all homes and buildings according to the stringent professional standards and code of ethics set forth by the American Society of Home Inspectors (ASHI). The ASHI standards are designed to identify and disclose to the client certain conditions of the major systems as these conditions exist at the time of the inspection. These standards are designed for a visual inspection of the readily accessible areas of the included system. A copy of these standards will be provided upon request or can be obtained by calling the ASHI automatic "Information-On-Demand" phone number at 1-800-743-2744

Home or building inspections performed under these standards should not be construed as a compliance inspection of any governmental or non-governmental codes or regulations. Inspections performed under these standards are essentially visual; are based on the experience and opinion of the inspector; and are not intended to be technically exhaustive. Inspections performed under these standards are not meant to be warranties nor guarantees of adequacy of performance of the structures, systems, or their component parts.

This inspection does not include an inspection for construction or other materials which might be hazardous to your health. It is possible that such materials may be present and not noted in this report.

This inspection does not include the testing or inspection of security systems, intercoms, communication systems, video, or sprinkler systems. These items are highly specialized and individualistic. Clark Inspections recommends that you have the seller and/or real estate agent/broker demonstrate the operation and serviceability of these systems to you prior to the closing of the sale.

Mechanical equipment is inspected for operability only and may contain undisclosed defects which may significantly impair it's usefulness.

Defects are examined and a determination is made on how a particular defect will affect interrelated building parts and whether immediate repairs are required.

Since all buildings have defects, it is important to know and understand what they are and how they affect the house and property. Some of the defects mentioned in this report may be quite typical, and found in other homes of comparable age and price. Some however, may not. We make our best attempt to distinguish this for you in both verbal and written reports.

REPORT SUMMARY

The comments in this report are categorized. General information is given on the type of materials and construction methods. Specific information is given pertaining to the condition of a component and applicable repair and maintenance work that may be required.

Statements, representations, or conclusions offered by the inspector are the considered opinion of the inspector, but these statements, representations, or conclusions do not constitute an expressed or implied warranty of any kind. Neither the inspector nor Clark Inspections Inc. shall be liable for any direct, special, incidental, or consequential damages under an circumstances whatsoever, whether arising in tort, negligence, or contract, nor for any loss, claim, expense, or damage caused by or arising out of his or its inspection of a structure, nor will the inspector or Clark Inspections Inc. indemnify or hold others harmless for any loss, claim, expense, or damage arising out of his or its inspection of a structure.

ACTION ITEMS. SIGNIFICANT DEFECTS AND/OR HEALTH AND SAFETY ISSUES

Non-operational (Action) items, safety or health issues, areas with limited viewing for proper inspection and components that do not serve their intended function (Significant Defects) are listed here. These items will likely require further evaluation and repair by licensed tradespeople.

Please Read entire report

BUILDING SITE

PATIO

The patio has settled differentially. The patio remains functional despite this condition. However, the raised edges of the concrete can be a trip hazard for some people. Grinding down the raised edges of the concrete will mitigate the hazard. Repairs should be made as necessary.

WALKWAY

The walkway has cracked and settled differentially. This was probably caused by inadequate preparation of the soil prior to the placement of the concrete. This condition can be repaired by pressure grouting the sunken portion of the walkway or by removing and replacing it. Grinding down the raised edges of the concrete will also mitigate the hazard. The walkway remains functional despite this condition. However, the raised edges of the concrete can be a trip hazard for some people. Repairs should be made as necessary.

GARAGE

ATTACHED GARAGE

GARAGE DOOR OPENER

The Photo-eye beam was installed to high above the floor of the garage to adequately offer protection for small children and/or pets. We recommend that the photo-eye be lowered to within 4-6" of the floor.

FIRE SEPARATION

There are voids in the fire resistive barrier between the living space and garage that will allow flames to penetrate. The gypsum barrier slows the spread of a fire from the garage to the structure and/or living space. Patching the voids with a fire retardant caulk is recommended.

There are voids (adjacent the overhead door brackets) in the fire resistive barrier between the living space and garage that will allow flames to penetrate. The gypsum barrier slows the spread of a fire from the garage to the structure and/or living space. Patching the voids with a fire retardant caulk is recommended.

PASSAGE DOOR

The self closing hinge has been disabled and therefore the door is no longer part of the fire rated assembly between the living space and garage. Resetting the self closing hinge spring is recommended.

ELECTRICAL SYSTEM

SERVICE PANEL

One of the neutral wires is double tapped on the buss bar. Double tapping means that two conductors share a single terminal. Double tapped terminals can loosen and overheat and therefore are not permitted unless the terminal is specifically listed for multiple wires. This defect is easily repaired by connecting the two wires to a "pig tail", securing them with a wire cap, and then inserting the pig tail conductor under the terminal.

WIRING

The transformer in the attic is detached and is hanging from its wires. This is a hazard. The transformer should be attached and secured to the junction box.

Loose electrical cables were observed in the garage. Loose cables are vulnerable to damage. All loose cables should be secured at 4' intervals using approved cable staples.

RECEPTACLES

There are several dead receptacles in the primary bedroom. Repairs should be made as necessary.

The cover plate is missing from a receptacle in the garage. This is a shock and fire hazard. The installation of a cover plate is recommended.

GFCI RECEPTACLES

The installation of additional GFCI protection in the garage, exterior and for all of the kitchen receptacles is recommended.

WATER HEATER

EXPANSION TANK

The expansion tank is not adequately secured to the wall. As code requirements start to call for engineered expansion tank supports we recommend the installation of seismic restraints to secure the expansion tank instead of allowing it to simply depend on piping connections that could result in damage to the water pipe and leakage during an earthquake.

GENERAL COMMENTS

The water heater is nearing the end of its service life. The need for water heater replacement should be anticipated.

KITCHEN

AIR GAP

The dishwasher drain lacks an air gap. The dishwasher will function without one, but there is a risk of contamination of the inside of the dishwasher by waste water. The installation of an air gap above the flood rim of the sink is recommended.

RANGE

No tip out protection was installed for the range. This is a hazard for small children. We recommend tip out protection devices be installed.

BATHROOMS

PRIMARY BEDROOM BATHROOM

BATHTUB

The hydromassage tub was filled to the overflow, however the hydromassage tub circulation system was not connected to a power source. Its function was not verified.

TOILET

The toilet is loose where it mounts to the floor. A loose toilet will eventually start to leak and will damage the flooring material, underlayment and subfloor. The most reliable fix for this condition is to remove the toilet and install a new wax seal. The toilet should then be securely mounted to the floor.

FIREPLACES, WOOD STOVES AND SPACE HEATERS

GAS STOVE INSERT

The pilot light was not working and the gas stove insert was not tested. The operation of the gas appliance was not verified.

The condition of the fireplace in which the insert is placed was not visible for inspection and its condition was not determined. The smoke pipe should extend from the top of the insert, through the smoke chamber and into the flue. This portion of the installation is not visible for inspection. You should have a chimney sweep examine this component when the chimney flue is cleaned.

The gas supply for the fireplace is located on the wall or floor adjacent to the hearth. The key that turns on this valve should be kept out of the reach of children.

MAINTENANCE ITEMS AND/OR COMPONENTS NEARING THE END OF THEIR SERVICE LIFE

Any item that in the opinion of the inspector is nearing the end of its normal service life and/or conditions that need repair, maintenance and/or upgrades, but have not affected basic functions are listed herein.

BUILDING SITE

VEGETATION

Trees are touching the building on the south side. Low hanging tree branches can damage the roof, gutters, siding, doors and/or windows. Tree branches should be trimmed back where necessary.

DRIVEWAY

Cracks were observed in the concrete surface of the driveway. Minor cracks can be sealed to minimize moisture entry and further settlement of the concrete. Minor cracks are common and do not affect the serviceability of the concrete.

FENCES AND GATES

Portions of the fence are deteriorated. Fences should be repaired or replaced as necessary.

The gate is properly installed and is performing its intended function.

BUILDING EXTERIOR

PEST CONTROL

Soil is close to or in contact with siding in some areas around the building exterior. Good building practice requires that foundation walls or pier footings supporting wood frame construction, extend at least 8" above the finish grade with at least a 6" clearance between the top of the soil and the bottom of the wood finish materials. Soil in direct contact with wood creates a hospitable environment for wood destroying organisms. Establishing these minimum clearances is recommended.

SOFFITS AND OVERHANGS

There are openings adjacent the ends of the outlook boards under the overhang through which insects and rodents can enter into the attic. These openings should be covered with wood, wire mesh or filled with aerosol foam.

Gaps over 1/4" in size adjacent the brick cladding and soffit vent blocks will allow insects and rodents to enter the structure. Covering any gaps with screening, a strip of trim and/or caulking is recommended.

GUTTERS AND DOWNSPOUTS

The 2" round downspout is too small and is more vulnerable to clogging than the larger rectangular ones. Consideration should be given to upgrading the drain line size.

PAINT

Localized areas of needed paint were noted on trim boards above the roof line. Paint protects the wood from cupping, checking, warping and rot. These areas should be scraped, primed and repainted.

ROOF

CHIMNEYS

The rock is spalling on the exposed portion of the chimney. Spalling occurs during the winter when the surface of the stone absorbs moisture and freezes. The water expands as it freezes causing the surface of the stone to flake off. Spalling can be prevented by applying a sealer to the surface of the stone. For maximum protection, the sealer should be reapplied every 2-3 years.

FLASHINGS

Built up mastic is used to seal around the chimney to roof intersections. These intersections sealed with roofing mastic will shrink, crack and eventually leak, resealing the flashings with mastic will extend their service life.

Counter flashings are missing around the chimney. This may allow leakage to occur. The installation of counter flashings is recommended.

ATTIC

PEST CONTROL

There is evidence of rodent activity in the attic. The first step in eliminating rodents from the attic is to seal all possible entry points using wire mesh, caulking, wood, stainless steel wool, or aerosol foam. Careful work sealing cracks, holes and gaps over 1/4" in size will discourage further activity. Once this work is completed, snap traps baited with peanut butter should be installed and monitored. The absence of rodents in the traps typically means that the rodents have been excluded from the area.

GARAGE

ATTACHED GARAGE

APPLIANCES

The washer cycle timer is very noisy. We recommend that it be serviced or replaced to restore quiet operation.

Upgrading the washer connections to high pressure (steel braided) lines is recommended.

BATHROOMS

PRIMARY BEDROOM BATHROOM

TUB WALLS

Grout is missing from between some of the wall tiles. This can allow water to enter through the tile and can damage the walls. Regrouting the wall tile is recommended.

PLUMBING SYSTEM

INTERIOR WATER SUPPLY PIPES

There are water pipes in the crawlspace that are not adequately insulated and could freeze. The installation of foam pipe insulation on all exposed water pipes is recommended.

WATER PRESSURE

The water pressure at 110 PSI is excessive. The normal range is 30-80 PSI. High water pressure can result in leaking valves, detached supply tubes, water hammer and is hard on solenoid valves. The installation of a pressure reduction valve is recommended.

INTERIOR

FLOORS

Carpet is worn and dirty. Carpet replacement should be considered.

DOORS

Some of the doors are missing their door stops. This condition will lead to damage of the wall surfaces. Door stops should be installed where necessary.

CLOSET DOORS

The floor guides are missing from the bypass closet doors in the hallway. Missing floor guides could result in damage to the doors. The installation of floor guides is recommended.

The closet door pulls in the primary bedroom are offset and do not allow the closet doors to open easily. This could result in damage to the doors. Consideration should be given to relocating of the door pulls.

INSULATION

FLOOR INSULATION

Several insulation batts are missing and numerous were not properly secured and have falling down. The fallen

batts should be reinstalled and secured. The missing batts should be replaced.

CRAWLSPACE

VAPOR RETARDER

The support post concrete piers are covered with the plastic vapor retarder. This allows the transmission of water vapor from the soil up and into the floor framing. The plastic vapor retarder should be removed from the pier so that it covers at least 85% of the entire surface of the soil only.

PEST CONTROL

Cellulose forms were left in place on the pier footings. This cellulose is conducive to the infestation of various wood destroying organisms. The removal of the cellulose is recommended.

The crawlspace access door is not rodent proof. The installation of a tight fitting access door is recommended to exclude rodents from the crawlspace.

Several of these items will likely require further evaluation and repair by licensed tradespeople. Other minor items are also noted in the report and could be mentioned but none of them affect the habitability of the house.

Thank you for selecting our firm to do your home inspection. If you have any questions regarding the inspection report or the home, please feel free to call us.

Sincerely,

Terry Clark 206-660-9200 Clark Inspections

GENERAL INFORMATION

CLIENT & SITE INFORMATION:

DATE OF INSPECTION: 5/29/2023.

INSPECTOR'S NAME: Terry Clark.

CLIENT NAME: Mr. Justin Stobb.

MAILING ADDRESS: 17130 26th Avenue SE

Bothell WA.

<u>CLIENT E-MAIL ADDRESS</u> <u>jstobb@gmail.com.</u>

ADDRESS OF PROPERTY 17130 26th Avenue SE

INSPECTED Bothell WA.

CLIMATIC CONDITIONS:

WEATHER: Overcast.

APPROXIMATE OUTSIDE 65 degrees.

TEMPERATURE:

BUILDING CHARACTERISTICS:

MAIN ENTRY FACES: East.

ESTIMATED AGE OF BUILDING: The building is approximately 46 years old.

BUILDING TYPE: Single family residence.

SPACE BELOW GRADE: Crawlspace.

SCOPE, PURPOSE AND LIMITATIONS

RESIDENTIAL

The purpose of this inspection was to discover and evaluate major defects, deficiencies and deferred maintenance found in the main components of the house and in the building site immediately around the building inspected. A major defect or deficiency is a system or component that in the judgment of the inspector, would cost in excess of \$500.00 to repair or replace, is not performing it's intended function, or adversely affects the habitability of the dwelling or building. Defects are examined and a determination is

made on how a particular defect will affect interrelated building parts and whether immediate repairs are required.

The major components in this report are categorized. General information is given on the type of materials and construction methods. Specific information is given pertaining to the condition of a component and applicable repair and maintenance work that may be required.

Since all buildings have defects, it is important to know and understand what they are and how they affect the house and property. Some of the defects mentioned in this report may be quite typical, and found in other homes of comparable age and price. Some, however, may not. We make our best attempt to distinguish this for you in both the verbal and written reports.

Clark Inspections inspectors inspect all homes and buildings according to the stringent professional standards and code of ethics set forth by the American Society of Home Inspectors (ASHI). The ASHI standards are designed to identify and disclose to the client certain conditions of the major systems as these conditions exist at the time of the inspection. These standards are designed for a visual inspection of the readily accessible areas of the included system. A copy of these standards will be provided upon request or can be obtained by calling the ASHI automatic "Information-On-Demand" phone number at 1-800-743-2744.

Home or building inspections performed under these standards should not be construed as a compliance inspection of any governmental or non-governmental codes or regulations. Inspections performed under these standards are essentially visual; are based on the experience and opinion of the inspector; and are not intended to be technically exhaustive. Inspections performed under these standards are not meant to be warranties nor guarantees of adequacy of performance of the structures, systems, or their component parts.

This inspection does not include an inspection for construction or other materials which might be hazardous to your health. It is possible that such materials may be present and not noted in this report.

This inspection does not include the testing or inspection of security systems, intercoms, communication systems, video, or sprinkler systems. These items are highly specialized and individualistic. Clark Inspections recommends that you have the seller and/or real estate agent/broker demonstrate the operation and serviceability of these systems to you prior to the closing of the sale.

Mechanical equipment is inspected for operability only and may contain undisclosed defects which may significantly impair it's usefulness.

Statements, representations, or conclusions offered by the inspector and/or by Clark Inspections are based solely upon a visual examination of the exposed areas of the structure inspected. Areas of the structure which are not exposed to the naked eye cannot be inspected, and no conclusions, representations, or statements offered by the inspector are intended to relate to areas not exposed to view. Hidden defects could have a significant impact on the visually based conclusions, statements, and representations made by the inspector.

Statements, representations, or conclusions offered by the inspector are the considered opinion of the inspector, but these statements, representations, or conclusions do not constitute an expressed or implied warranty of any kind. Neither the inspector nor Clark Inspections shall be liable for any direct, special, incidental, or consequential damages under any circumstances whatsoever, whether arising in tort, negligence, or contract, nor for any loss, claim, expense, or damage caused by or arising out of his or its inspection of a structure, nor will the inspector or Clark Inspections indemnify or hold others harmless for any loss, claim, expense, or damage arising out of his or its inspection of a structure.

If you receive information from another building inspection professional, contractor or

GENERAL COMMENTS

RECOMMENDATIONS

BUILDING CODES

trades person that is in conflict with ours, or if you discover a major defect in your home or building that was not described in your verbal or written reports, please call us immediately.

Certain building designs and/or building site topography may not qualify for earthquake insurance. Each company has its own underwriting policies. You should check with your insurance agent to determine whether or not your insurance company will write an earthquake policy on this property.

There may be information pertinent to this property which is a matter of public record. A search of public records is not within the scope of this inspection. We recommend you review all applicable public records that pertain to this property.

A code is a system of rules and procedures, the purpose of which is to provide minimum standards to safeguard life, health, and property by regulating certain aspects of building design, construction, use and maintenance. Local codes are usually based on model codes. A community may amend or adopt only parts of a model code. These local codes may not always be the latest version of the model code. Code enforcement is nearly always a local government responsibility and is handled in several ways depending on the type of code and community involved. All model codes and most local codes, grant the code compliance inspector or building official the right to interpret the code to suit special situations. This makes the building official the final authority, not the code book.

Answering the question "Does this meet code?" depends on the building's age, when remodels and upgrades were performed and which codes if any are enforced. This information may not be readily available to the home inspector. Private inspectors usually can determine if an item complies with applicable national model codes, if they know when the work was done and what code was applicable at that time. Local municipalities adopt and enforce national model codes at their discretion. Private building inspectors are typically not permitted to perform code compliance inspections. Code compliance inspections are typically performed by the local code enforcement official. Private building inspectors check to determine whether or not an item performs its intended function or is in need of repair.

Code enforcement usually is a local question and subject to the interpretation by the building code enforcement official. Most communities do not require an existing building to meet "code" prior to sale.

Specific code questions can be referred to the local building official. however, you must realize that if city inspectors check a building, they have the authority to require corrections of any violation. Private building inspectors act solely in an advisory capacity. Their objective reports are a tremendous benefit to anyone purchasing or selling real estate.

BUILDING SITE

The evaluation of the building site and grounds includes grading, roof water and surface drainage systems, fencing, gates, walkways, curbs, driveways, patios, and retaining walls connected to or directly adjacent the structure. These items are visually examined for proper function, excessive or unusual wear and general state of repair. Components or portions of components may not be visible because of soil, vegetation, storage of personal effects and/or the nature of construction. In such cases these items are considered inaccessible and are not inspected. Lawn irrigation systems, fountains, and low voltage decorative garden lights are not included in this inspection.

The following components were inspected:

ROOF WATER DRAIN SYSTEM

The downspout at the northeast corner of the building discharges on the ground adjacent to the foundation. Roof water discharging on the ground adjacent to the foundation wall and exterior wood door frames is one of the most common causes of water or moisture problems at ground floor occupancies. Clogged downspouts and scuppers also frequently cause or exacerbate moisture or water entry problems. Consideration should be given to diverting water away from the exterior walls, doors and foundation system. Consult with a drain systems specialist for additional information and cost estimates.

The roof water drain at the northwest corner of the building was tested by inserting a hose into the drain inlet and then letting it run for 10 minutes. There was no water back-up or overflow from the drain line inlets tested.

The building site is well drained. The finish grade slopes away from the house. No evidence of recent building site flooding, drainage or soil stability problems was observed.

Dense shrubbery and trees planted too close to the building can damage siding and the roof overhang and interfere with drainage and air movement, thus promoting fungus growth and accelerated deterioration of exterior finishes and wood. Trees and shrubs in contact with the building also provide carpenter ants with a route into walls or attics. Trees and shrubs should be trimmed back, where required. When landscaping, trees and shrubs should be planted back away from the building so that they have room to grow.

Trees are touching the building on the south side. Low hanging tree branches can damage the roof, gutters, siding, doors and/or windows. Tree branches should be trimmed back where necessary.

Cracks were observed in the concrete surface of the driveway. Minor cracks can be sealed to minimize moisture entry and further settlement of the concrete. Minor cracks are common and do not affect the serviceability of the concrete.

The patio has settled differentially. The patio remains functional despite this condition.

GRADING

VEGETATION

DRIVEWAY

PATIO

However, the raised edges of the concrete can be a trip hazard for some people. Grinding down the raised edges of the concrete will mitigate the hazard. Repairs should be made as necessary.

WALKWAY

The walkway has cracked and settled differentially. This was probably caused by inadequate preparation of the soil prior to the placement of the concrete. This condition can be repaired by pressure grouting the sunken portion of the walkway or by removing and replacing it. Grinding down the raised edges of the concrete will also mitigate the hazard. The walkway remains functional despite this condition. However, the raised edges of the concrete can be a trip hazard for some people. Repairs should be made as necessary.

Many legal and public works departments have defined a trip hazard as an irregularity in a walking surface exceeding one inch (1") in height. All walking surfaces should maintain, free of a vertical surface change of 3/4" or more, in the interest of public and personal safety.

FENCES AND GATES

Portions of the fence are deteriorated. Fences should be repaired or replaced as necessary.

The gate is properly installed and is performing its intended function.

BUILDING EXTERIOR

The evaluation of the building exterior includes the paint, stain, siding, windows, doors, flashing, trim, fascia, eaves, soffits, decks, porches balconies and railings. These items are visually examined for proper function, excessive or unusual wear and general state of repair. Components or portions of components may not be visible because of soil, vegetation, storage of personal effects and/or the nature of construction. In such cases these items are considered inaccessible and are not inspected.

The following components were inspected:

PRIMARY EXTERIOR **CLADDING**

WALL Cedar lap siding is used as an exterior wall cladding. Cedar is a wood that is durable and moderately resistant to decay. Maintaining the finish on the exposed siding will maximize its service life. The siding shows minor wear and deterioration typically caused when the exterior finish is not maintained. The deterioration is cosmetic and does not affect the function of the siding. No action is indicated.

CLADDING

SECONDARY EXTERIOR WALL The front of the building is clad in brick. Brick is one of the oldest and most durable of all wall claddings. It does not burn, rot, or dent. It does not require painting. It will generally last the lifetime of the building. However, brick is susceptible to earthquake damage.

> The brick is a veneer installed over the wood wall structure. It is not a structural component of the wall. The brick has been properly installed and is functioning as intended.

PEST CONTROL

Soil is close to or in contact with siding in some areas around the building exterior. Good building practice requires that foundation walls or pier footings supporting wood frame construction, extend at least 8" above the finish grade with at least a 6" clearance between the top of the soil and the bottom of the wood finish materials. Soil in direct contact with wood creates a hospitable environment for wood destroying organisms. Establishing these minimum clearances is recommended.

SOFFITS AND OVERHANGS

The building has adequate overhangs. Overhangs protect the exterior walls, windows, doors, siding and exterior finish from the ravages of direct rain fall. Buildings with adequately sized overhangs will generally require less frequent exterior maintenance and are less likely to suffer from moisture related problems on the exterior walls.

There are openings adjacent the ends of the outlook boards under the overhang through which insects and rodents can enter into the attic. These openings should be covered with wood, wire mesh or filled with aerosol foam.

Gaps over 1/4" in size adjacent the brick cladding and soffit vent blocks will allow insects and rodents to enter the structure. Covering any gaps with screening, a strip of trim and/or caulking is recommended.

GUTTERS AND DOWNSPOUTS

Roof runoff is collected and channeled into the downspouts by aluminum gutters fastened to the rafter tails. The gutters and downspouts are properly installed and are performing their intended function. Gutters should be cleaned regularly to prevent clogging and overflow.

The 2" round downspout is too small and is more vulnerable to clogging than the larger rectangular ones. Consideration should be given to upgrading the drain line size.

PAINT

The exterior paint and caulking is in good condition and is functioning as intended. Paint protects the wood from cupping, checking, warping and rot.

Localized areas of needed paint were noted on trim boards above the roof line. Paint protects the wood from cupping, checking, warping and rot. These areas should be scraped, primed and repainted.

PATIO COVER

The patio is covered by a wood structure with fiberglass roof panels. The roof structure and fiberglass panels are functioning as intended.

PORCH

The porch is installed close to the ground making it more vulnerable to deterioration. The proximity of the porch to the ground also prevented an inspection of the framing.

PORCH RAILING EXTERIOR DOORS

The porch railings are well constructed and are performing their intended function.

The exterior doors are properly installed and are functioning as intended.

ROOF

We evaluate the condition of the roof system by inspecting the roofing material, skylights, flashings, penetrations and roof water drainage system for damage and deterioration. If we observe conditions such as damage, deterioration, defects in materials or workmanship, these items will be noted in your report. We may also offer opinions concerning repair and replacement. Opinions stated herein concerning the condition of the roof and roof service life are based on the condition of the roof system at the time of the inspection. These opinions do not constitute a warranty that the roof is, or will remain, free of leaks. All roof systems require annual maintenance and occasional repair. Failure to perform routine roof maintenance will usually result in leaks and accelerated deterioration of the roofing material. Our estimate of the life expectancy of the roof is based on the assumption that the roof will be properly repaired and maintained during that period.

The following components were inspected:

GENERAL INFORMATION

The roofing material is asphalt composition shingles. The slope or pitch of the roof is medium. Metal gutters are used to collect the roof water drainage. The roof is approximately 6 years old.

INSPECTION METHOD

The inspection of this roof was conducted from the roof surface. The inspector walked on the roof and made a visual inspection of the components listed below.

CHIMNEYS

The visible portion of the masonry chimney is properly constructed and is in serviceable condition.

The rock is spalling on the exposed portion of the chimney. Spalling occurs during the winter when the surface of the stone absorbs moisture and freezes. The water expands as it freezes causing the surface of the stone to flake off. Spalling can be prevented by applying a sealer to the surface of the stone. For maximum protection, the sealer should be reapplied every 2-3 years.

FLASHINGS

An inspection of the roof flashings revealed the following defects:

Built up mastic is used to seal around the chimney to roof intersections. These intersections sealed with roofing mastic will shrink, crack and eventually leak, resealing the flashings with mastic will extend their service life.

Counter flashings are missing around the chimney. This may allow leakage to occur. The installation of counter flashings is recommended.

GENERAL COMMENTS

The roofing material was properly installed and is in serviceable condition. With proper care and maintenance this roof should remain serviceable for up to 15 more years.

Report: Justin Stobb Address: 17130 26th Avenue SE Page 11

ATTIC

The attic contains the roof framing and serves as a raceway for components of the plumbing, electrical and mechanical systems. There are often heating ducts, bathroom vent ducts, electrical wiring, chimneys and gas appliance vents in the attic. We examine the visible portions of the various systems and components for proper function, excessive or unusual wear, general state of repair, roof leakage, attic venting and misguided improvements. When low clearance and/or deep insulation prohibit walking in an unfinished attic, inspection will be performed from the access opening only.

The following components were inspected:

ACCESS The attic access is located in the garage. The attic was entered and inspected from

within.

VENTILATION
PEST CONTROL

The attic is adequately vented.

There is evidence of rodent activity in the attic. The first step in eliminating rodents from the attic is to seal all possible entry points using wire mesh, caulking, wood, stainless steel wool, or aerosol foam. Careful work sealing cracks, holes and gaps over 1/4" in size will discourage further activity. Once this work is completed, snap traps baited with peanut butter should be installed and monitored. The absence of rodents in the traps typically means that the rodents have been excluded from the area.

GARAGE

The garage often contains major components of the plumbing, heating and electrical systems. These components are discussed under their respective headings. Components that were tested and/or inspected in the garage and reported here include the garage floor, overhead door(s), automatic openers and fire resistive barriers.

ATTACHED GARAGE - The following components were inspected:

GARAGE FLOOR

There are small shrinkage cracks visible in the concrete, however, there is no vertical displacement of any portion of the slab. Shrinkage cracks are common in garage floors and are not considered a structural defect. The garage floor is properly installed and is functioning as intended.

OVERHEAD GARAGE DOORS

The garage is fitted with a single roll-up door. The garage door is properly installed and is performing its intended function.

GARAGE DOOR OPENER

The garage door opener was tested and was functional. The auto stop reverse safety switch was functioning as intended.

The Photo-eye beam was installed to high above the floor of the garage to adequately offer protection for small children and/or pets. We recommend that the photo-eye be lowered to within 4-6" of the floor.

FIRE SEPARATION

There are voids in the fire resistive barrier between the living space and garage that will allow flames to penetrate. The gypsum barrier slows the spread of a fire from the garage to the structure and/or living space. Patching the voids with a fire retardant caulk is recommended.

There are voids (adjacent the overhead door brackets) in the fire resistive barrier between the living space and garage that will allow flames to penetrate. The gypsum barrier slows the spread of a fire from the garage to the structure and/or living space. Patching the voids with a fire retardant caulk is recommended.

PASSAGE DOOR

The self closing hinge has been disabled and therefore the door is no longer part of the

fire rated assembly between the living space and garage. Resetting the self closing hinge spring is recommended.

Page 13

There are unprotected receptacles in the garage. The installation of GFCI protection for all of the garage receptacles is recommended.

The hookups for the washer are properly installed and in serviceable condition. The washer itself was operated through a partial cycle, however we did not conform the complete operation of the cycle timer.

The washer cycle timer is very noisy. We recommend that it be serviced or replaced to restore quiet operation.

Upgrading the washer connections to high pressure (steel braided) lines is recommended.

The hookups for the dryer are properly installed and in serviceable condition. The dryer itself was operated through a partial cycle, however we did not confirm the complete operation of the cycle timer.

DRYER VENT SINK

SINK FAUCET

RECEPTACLES

APPLIANCES

DRAINS, TRAPS AND ARMS

The dryer vent is properly installed and in serviceable condition.

The laundry sink is properly installed and is in good condition.

The sink faucet is properly installed and is in good condition.

TRAP The sink drain is properly installed and is performing its intended function.

© Clark Inspections

ELECTRICAL SYSTEM

An electrical system consists of the service, distribution, wiring and convenience outlets (switches, lights and receptacles). Our examination of the electrical system includes the exposed and accessible wiring, service panels, subpanels, overcurrent protection devices, light fixtures and all accessible wall receptacles. We look for adverse conditions such as improper installation of aluminum wiring, lack of grounding, overfusing, exposed wiring, open-air wire splices, reversed polarity and defective GFCIs. The hidden nature of the electrical wiring prevents inspection of every length of wire. Telephone, video, audio, security system and other low voltage wiring is not included in this inspection. We recommend you have the seller demonstrate the serviceability of these systems to you.

The following components were inspected:

ELECTRICAL **SPECIFICATIONS** SYSTEM The voltage is 120/240 single phase three wire service. The power is delivered to this building via an underground service lateral. The amperage rating of this service is 200. Copper wire is used for all 120 volt circuits. Aluminum is used for some of the 240 volt circuits. Non-metallic sheathed cable (Romex) is the type of wiring used throughout the

house. The grounding of the service is provided by two driven rods.

UNDERGROUND LATERAL

SERVICE The underground service lateral was not visible for inspection. However, there was 120/240 volt power to the building which suggests that it is functioning as intended.

SERVICE PANEL LOCATION

The service panel is located in the garage.

MAIN DISCONNECT LOCATION

The main disconnect is an integral part of the service panel. The ampacity of the main disconnect is 200 amps.

SERVICE

ENTRANCE The service entrance conductors are 4/0 aluminum and have an ampacity of 200 amps. CONDUCTORS/CABLES/RACEW The service entrance conductors are properly installed and in serviceable condition.

AYS

The capacity of the electrical service is 200 amps. A 200 amp service is adequate for this house with the existing electrical equipment. There is also room to add additional circuits if necessary.

SERVICE **GROUNDING**

SERVICE AMPACITY

BONDING

AND The service grounding electrode conductor attachment point was not visible for inspection. The adequacy of the service ground was not determined. The evaluation of this connection may require removal of finish materials and is beyond the scope of this

SERVICE PANEL

The electrical service panel is properly installed and in serviceable condition except where noted below.

One of the neutral wires is double tapped on the buss bar. Double tapping means that two conductors share a single terminal. Double tapped terminals can loosen and overheat and therefore are not permitted unless the terminal is specifically listed for multiple wires. This defect is easily repaired by connecting the two wires to a "pig tail", securing them with a wire cap, and then inserting the pig tail conductor under the terminal.

OVER CURRENT PROTECTION

Circuit breakers are used for over current protection. The circuit breakers are properly installed and the ampacity of the connected wires is compatible with that of the circuit breakers. The circuit breakers were not tested.

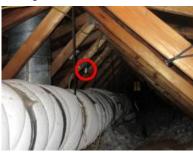

WIRING

The visible portions of the wiring are properly installed except where noted below.

The transformer in the attic is detached and is hanging from its wires. This is a hazard. The transformer should be attached and secured to the junction box.

Loose electrical cables were observed in the garage. Loose cables are vulnerable to

damage. All loose cables should be secured at 4' intervals using approved cable staples.

ALUMINUM WIRING

RECEPTACLES

This house uses stranded aluminum wire for service entrance conductors and for dedicated major appliance circuits. This type of aluminum wire circuitry is typically found in most houses and is considered safe and reliable when installed correctly.

All of the readily accessible receptacles were tested. Testing revealed defects requiring repair. These defects are outlined below.

There are several dead receptacles in the primary bedroom. Repairs should be made as necessary.

The cover plate is missing from a receptacle in the garage. This is a shock and fire hazard. The installation of a cover plate is recommended.

GFCI RECEPTACLES

A ground fault circuit interrupter (GFCI) is a device that detects ground faults (current leakage to ground). It protects you from electrocution. GFCI protection is required for receptacles in bathrooms, kitchens, garages, unfinished basements, crawlspaces and at exterior receptacles.

AFCI RECEPTACLES

The installation of additional GFCI protection in the garage, exterior and for all of the kitchen receptacles is recommended.

AFCI protection is required for all 15 and 20 amp branch circuits to have protection from the entire branch circuit when that circuit has outlets in dwelling family homes, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas.

Replacement receptacles are now required to be arc-fault circuit interrupter (AFCI) protected. This means that if you are replacing an old outlet in an old home in a location that needs AFCI protection in a new home, the replacement outlet needs to be AFCI protected.

LUMINARIES

All of the accessible luminaries were tested and were found to be functional.

Report: Justin Stobb Address: 17130 26th Avenue SE

Page 16

SWITCHES

All of the accessible switches were tested and were found to be properly wired and functional.

Report: Justin Stobb Address: 17130 26th Avenue SE Page 17

HEATING SYSTEM

A natural gas, propane or oil fired furnace or boiler consists of the self contained furnace or boiler, ducts or pipes for heated air or water distribution, thermostats for regulating the amount of heat and a vent system for removing the combustion gases from the building. The readily accessible portions of these items are examined for defects and are tested using normal operator controls. Most heating systems should be serviced annually by a qualified service technician. Failure to perform regular maintenance will affect the reliability of the heating system and will reduce service

FORCED AIR HEATING SYSTEM - The following components were inspected:

GENERAL INFORMATION Heat is provided by a high efficiency natural gas fired condensing furnace. The furnace

is located in the garage. The furnace is approximately 16 years old. The input rating of the furnace is 60,000 BTU. This BTU rating is typical of a home of this size and age.

GAS PIPING The flex connector is properly installed and is performing its intended function.

AUTOMATIC GAS VALVE The automatic gas valve or safety valve is designed to prevent the emission of fuel into

the furnace if it does not detect heat for ignition. These valves are generally very reliable.

The automatic gas valve was functioning as intended.

IGNITION The furnace uses an electronic spark ignition. This component was functioning as

intended.

BURNERS The gas burners are properly installed and are functioning as intended.

COMBUSTION AIR The combustion air provides the oxygen for the fuel burning appliances. Combustion air

also aids in the movement of combustion gases up the flue. Adequate ventilation around all fuel burning appliances is vital for their safe operation. The air can come from inside the house or from outside providing that the amount of air reaching the appliance is sufficient to maintain efficient combustion and draft. The combustion air supply is

adequate.

FLOOR

ELEVATION ABOVE GARAGE The burners in the furnace are elevated at least 18" above the garage floor in accordance with industry standards. This elevation prevents ignition of gasoline fumes

that might leak from cars, lawn mowers, gas cans, etc.

HEAT EXCHANGER The heat exchanger is not visible without disassembling and removing it from the

furnace. Cracks typically develop in heat exchangers after 10-20 years. Have your gas

furnace technician check the heat exchanger during the next major service.

DRAFT INDUCER The draft inducer pulls the combustion gases through the heat exchanger and pushes

them up the vent connector into the flue. The draft inducer was functioning as intended.

VENT The PVC plastic vent pipe for the condensing furnace is properly installed and is

functioning as intended.

BI OWFR The blower draws air from the return air ducts and pushes it over the heat exchanger

where it is heated. The air is then pushed through the distribution ducts into the rooms.

The blower was tested and was functioning as intended.

AIR FILTER The air filter is located in the return air plenum adjacent to the furnace. The air filter

should be cleaned or replaced at least 2-3 times during the heating season.

DUCTS The ducts are constructed out of sheet metal and flex duct. The ducts are properly

installed and are performing their intended function.

THERMOSTAT The thermostat is properly installed and the unit responded to the basic controls. This is

a programmable device with options for automatic temperature settings (up and down). Testing the automatic operations of this thermostat is beyond the scope of this

GENERAL COMMENTS The furnace responded to the thermostats call for heat and all major components were

functional. This type of furnace should be serviced annually.

Report: Justin Stobb Address: 17130 26th Avenue SE Page 18

WATER HEATER

Our review of water heaters includes the tank, gas and/or water connections, electrical connections, venting and safety valves. These items are examined for proper function, excessive or unusual wear, leakage and general state of repair. The hidden nature of piping and venting prevents inspection of every pipe, joint, vent and connection.

The following components were inspected:

EXPANSION TANK

LOCATION OF UNIT The water heater is located in the garage.

GENERAL INFORMATION

The water heater fuel is natural gas. The capacity of the water heater is 50 gallons. The

input rating of the burner is approximately 40,000 BTU. The water heater is approximately 16 years old. Water heaters of this type typically last about 10-15 years.

PRESSURE RELIEF VALVE The pressure relief valve is properly installed. The valve was not tested, as this could

cause the valve to leak.

SHUTOFF VALVE The shutoff valve for the water supply to the water heater is properly installed and is

functioning as intended.

WATER CONNECTIONS AT The water connections at the tank are properly installed and are performing their

TANK intended function.

The expansion tank is not adequately secured to the wall. As code requirements start to call for engineered expansion tank supports we recommend the installation of seismic restraints to secure the expansion tank instead of allowing it to simply depend on piping connections that could result in damage to the water pipe and leakage during an earthquake.

AUTOMATIC GAS VALVE The automatic gas valve or safety valve is designed to prevent the emission of fuel into

the appliance if it does not detect heat for ignition. These valves are generally very

reliable. The automatic gas valve was functioning as intended.

BURNER The gas burner is properly installed and is functioning as intended.

GAS PIPING The flex connector is properly installed and is performing its intended function.

VENT The water heater uses a type B vent from the top of the draft hood to the exterior. The

visible portion of the B vent is properly installed and is functioning as intended.

COMBUSTION AIR The combustion air provides the oxygen for the fuel burning appliances. Combustion air

also aids in the movement of combustion gases up the flue. Adequate ventilation around all fuel burning appliances is vital for their safe operation. The air can come from inside the house or from outside providing that the amount of air reaching the appliance is sufficient to maintain efficient combustion and draft. The combustion air supply is

adequate.

SEISMIC RESTRAINT The water heater is secured to the wall. This prevents it from falling over during an

earthquake and rupturing gas and water lines.

ELEVATION ABOVE GARAGE The burner of the water heater is elevated at least 18" above the garage floor in

FLOOR accordance with industry standards. This elevation prevents ignition of gasoline fumes

that might leak from cars, lawn mowers, gas cans, etc.

GENERAL COMMENTS The water heater is nearing the end of its service life. The need for water heater

replacement should be anticipated.

Report: Justin Stobb Address: 17130 26th Avenue SE Page 19

KITCHEN

The kitchen was inspected for proper function of components, active leakage, excessive or unusual wear and general state of repair. We inspect built-in appliances using normal operating controls. This includes running the dishwasher, operating the garbage disposal and microwave and checking the burners or heating elements in the stove and oven. Accuracy and/or function of clocks, timers, temperature controls and self cleaning functions on ovens is beyond the scope of our testing procedure. Refrigerators are not tested or inspected unless specifically noted.

The following components were inspected:

COUNTERTOPS The countertops are covered with slab quartz. The counter tops are properly installed

and are in good condition.

CABINETS The kitchen cabinets are properly installed and are in good condition.

FLOORING MATERIAL The floor is covered with wood. The floor is properly installed and is in good condition.

VENTILATION Ventilation in the kitchen is provided by a fan built into the bottom of the microwave oven

over the stove. The vent is ducted to the exterior. The vent fan is properly installed and is

performing its intended function.

SINK FAUCET The sink faucet is properly installed and is in good condition.

SINK The kitchen sink is properly installed and is in good condition.

DRAINS, TRAPS AND TRAP The sink drain is properly installed and is performing its intended function.

ARMS

AIR GAP

The dishwasher drain lacks an air gap. The dishwasher will function without one, but there is a risk of contamination of the inside of the dishwasher by waste water. The

installation of an air gap above the flood rim of the sink is recommended.

RANGE No tip out protection was installed for the range. This is a hazard for small children. We

recommend tip out protection devices be installed.

OVEN The oven was tested and was functioning as intended.

MICROWAVE The microwave oven was tested and was functioning as intended.

COOKTOP The cooktop elements were tested and were functioning as intended.

DISHWASHER The dishwasher was tested and was functioning as intended.

GARBAGE DISPOSAL The garbage disposal was tested and was functioning as intended.

REFRIGERATOR The refrigerator is functioning as intended.

RECEPTACLES There are unprotected receptacles in the kitchen. The installation of GFCI protection for

all of the kitchen receptacles is recommended.

BATHROOMS

Our inspection of the bathrooms consists of testing of the plumbing fixtures for condition and function. Defects such as leaks, cracked or damaged sinks, tubs and toilets will be listed under the heading of the bathroom in which they were found. The bathroom floor, tub and shower walls are examined for water damage. Ventilation fans are tested for proper operation. Cabinets and countertops are examined for excessive wear and deterioration. Hydromassage tubs are tested and the pump and related equipment are examined when accessible.

BATHROOM

LOCATION BATHTUB

Primary Bedroom.

The hydromassage tub was filled to the overflow, however the hydromassage tub circulation system was not connected to a power source. Its function was not verified.

TUB WALLS

The tub walls are properly installed and are in serviceable condition. Most ceramic tile is applied directly over gypsum board rather than on a concrete board such as "Durock" or "Wonder Board". Where the tile is applied directly over the gypsum board, it is critical that the tile grout be maintained to prevent water intrusion behind the tile. Missing or cracked grout should be repaired. Inside corners, and penetrations in the tile should be kept sealed with a high quality caulk.

Grout is missing from between some of the wall tiles. This can allow water to enter through the tile and can damage the walls. Regrouting the wall tile is recommended.

FLOORING MATERIAL

The floor is covered with ceramic tile. The tile is properly installed and is in good condition.

TOILET

The toilet is loose where it mounts to the floor. A loose toilet will eventually start to leak and will damage the flooring material, underlayment and subfloor. The most reliable fix for this condition is to remove the toilet and install a new wax seal. The toilet should then be securely mounted to the floor.

SINK

The bathroom sink is properly installed and is in good condition.

DRAINS. TRAPS AND

FAUCET FIXTURES

TRAP The sink drain is properly installed and is performing its intended function.

ARMS

The faucet fixtures were tested and were functioning as intended.

CABINETS

The finish on the bathroom cabinet is slightly worn. The cabinet is otherwise in good

condition.

COUNTERTOP

The countertops are covered with slab quartz. The counter tops are properly installed

and are in good condition.

Report: Justin Stobb Address: 17130 26th Avenue SE Page 21

VENTILATION Ventilation in this bathroom is provided by a ceiling fan. This fan was operated and was

found to be working satisfactorily.

GFCI RECEPTACLES A ground fault circuit interrupter (GFCI) is a device that detects ground faults (current

leakage to ground). It protects you from electrocution. GFCI protection is required for receptacles in bathrooms, kitchens, garages, unfinished basements, crawlspaces and at

exterior receptacles. GFCI protected receptacles were found in this bathroom.

BATHROOM

LOCATION Hallway.

SHOWER The one piece fiberglass shower unit is properly installed and in good condition.

GLASS ENCLOSURE The glass shower enclosure is labeled as tempered safety glass, is properly installed

and in good condition.

FLOORING MATERIAL The floor is covered with ceramic tile. The tile is properly installed and is in good

condition.

TOILET The toilet was flushed and was functioning as intended.

SINK The bathroom sink is properly installed and is in good condition.

DRAINS, TRAPS AND TRAP The sink drain is properly installed and is performing its intended function.

ARMS

FAUCET FIXTURES The faucet fixture was tested and was functioning as intended.

CABINETS The finish on the bathroom cabinet is slightly worn. The cabinet is otherwise in good

condition.

COUNTERTOP The countertop is covered with ceramic tile. The countertop is properly installed and in

good condition.

VENTILATION Ventilation in this bathroom is provided by a ceiling fan. This fan was operated and was

found to be working satisfactorily.

GFCI RECEPTACLES GFCI protected receptacles were found in this bathroom.

Report: Justin Stobb Address: 17130 26th Avenue SE Page 22

PLUMBING SYSTEM

A plumbing system consists of the water heater, domestic water supply lines, drain, waste and vent lines and gas lines. Inspection of the plumbing system is limited to the water heater, visible faucets, fixtures, valves, drains, traps, exposed pipes and fittings. These items are examined for proper function, excessive or unusual wear, leakage, and general state of repair. Valves are not tested except where specifically noted. The hidden nature of piping prevents inspection of every pipe and joint. A sewer lateral test, necessary to determine the condition of the underground sewer lines, is beyond the scope of this inspection. If desired, a qualified individual could be retained for such a test. Our review of the plumbing system does not include landscape irrigation systems, off site community water supply systems or private (septic) waste disposal systems. Review of these systems should be performed by qualified and licensed specialists prior to the close of escrow.

The following components were inspected:

WATER

PLUMBING SPECIFICATIONS SYSTEM The building is on a public water supply system. The building is connected to the

municipal sewer system. Copper tubing is used for the water supply piping. ABS plastic is used for the drain, waste and vent pipes.

MAIN WATER SHUTOFF VALVE

The main water supply shutoff valve is located in the garage. It was tested and was

functional.

MAIN WATER LINE

The main water line is buried underground and was not visible for inspection.

INTERIOR **PIPES**

SUPPLY Copper is considered one of the most desirable materials for interior supply pipes and is expected to last the lifetime of the building. The visible portions of the copper water

supply pipes are properly installed and functional except where noted below.

There are water pipes in the crawlspace that are not adequately insulated and could freeze. The installation of foam pipe insulation on all exposed water pipes is

recommended.

WATER PRESSURE The water pressure at 110 PSI is excessive. The normal range is 30-80 PSI. High water

pressure can result in leaking valves, detached supply tubes, water hammer and is hard on solenoid valves. The installation of a pressure reduction valve is recommended.

DRAIN AND WASTE PIPES ABS plastic is used for drain, waste and vent pipes. All of the visible drain pipes were

properly installed and functional. ABS is a durable, reliable material and should last the lifetime of the building. All drain, waste and vent pipes were stress tested by filling bathtubs and fixtures to the overflow and then draining them while simultaneously flushing the toilet and running the sinks and showers. No leaks were observed and all fixtures emptied in a reasonable amount of time with no fluctuation in the rate of flow

down the drain. This is commonly referred to as "functional drainage".

VENT PIPES The visible portions of the vent pipes are properly installed and are performing their

intended function.

FAUCET FIXTURES All faucet fixtures were tested and were functioning as intended.

SUPPLY PIPES

HOSE BIBBS AND EXTERIOR The hose bibbs are the old style that must be protected during freezing weather. This can be accomplished either by installing a foam cap over the bibb or by shutting off the

water supply at the indoor gate valve opposite the bibb and then opening the bibb to

allow the water to drain out.

The visible portions of the gas piping were properly installed and are performing their GAS PIPING

intended function. There was no odor of gas leakage at the time of the inspection.

GAS METER The gas meter is located on the south side of the building. The main gas shut off valve is installed on the high pressure line emanating out of the ground. This valve requires a wrench to open and close. Keeping a gas valve wrench or adjustable wrench accessible

near the gas meter is recommended.

INTERIOR

Our review of the interior includes inspection of walls, ceilings, floors, doors, windows, cabinetry, countertops, steps, stairways, balconies and railings. These features are examined for proper function, excessive wear and general state of repair. In some cases, all or portions of these components may not be visible because of furnishings and personal effects. In such cases these items are not inspected.

The following items were inspected:

GENERAL COMMENTS

The interior wall, floor, and ceiling surfaces were properly installed and generally in serviceable condition, taking into consideration normal wear and tear.

FLOORS Carpet is worn and dirty. Carpet replacement should be considered.

WALLS AND CEILINGS

There are minor cracks in the walls and/or ceilings. This is a common condition with this type of construction and does not indicate a structural deficiency. The cracks can be repaired or painted over during routine maintenance. Cracks in drywall that have been repaired will often reoccur several months after the repairs have been completed. This is due to seasonal movement of the structure caused by changes in humidity.

DOORS

All of the doors were tested and were found to be functioning as intended.

Some of the doors are missing their door stops. This condition will lead to damage of the wall surfaces. Door stops should be installed where necessary.

CLOSET DOORS

All of the closet doors were tested and were found to be functioning as intended.

The floor guides are missing from the bypass closet doors in the hallway. Missing floor guides could result in damage to the doors. The installation of floor guides is recommended.

The closet door pulls in the primary bedroom are offset and do not allow the closet doors to open easily. This could result in damage to the doors. Consideration should be given to relocating of the door pulls.

WINDOWS

The window frames are constructed from PVC and have insulated glass in them. All of the windows were tested and/or inspected. All of the windows tested and/or inspected were found to be functioning as intended.

SMOKE DETECTORS

There is a smoke detector inside each of the bedrooms and in the hallway outside of the bedrooms.

DOOR BELL

The doorbell was functioning as intended.

Report: Justin Stobb Address: 17130 26th Avenue SE Page 24

FIREPLACES, WOOD STOVES AND SPACE HEATERS

The following components were inspected:

GAS STOVE INSERT

The pilot light was not working and the gas stove insert was not tested. The operation of the gas appliance was not verified.

The condition of the fireplace in which the insert is placed was not visible for inspection and its condition was not determined. The smoke pipe should extend from the top of the insert, through the smoke chamber and into the flue. This portion of the installation is not visible for inspection. You should have a chimney sweep examine this component when the chimney flue is cleaned.

The gas supply for the fireplace is located on the wall or floor adjacent to the hearth. The key that turns on this valve should be kept out of the reach of children.

Report: Justin Stobb Address: 17130 26th Avenue SE

ENVIRONMENTAL ISSUES

Environmental issues include but are not limited to carbon monoxide, radon, asbestos, lead paint, lead contamination, toxic waste, formaldehyde, electromagnetic radiation, buried fuel oil tanks, ground water contamination and soil contamination. The absence of a statement on any of the environmental issues listed above does not necessarily mean that they are not present. We make reference to these substances only when we recognize them during the normal inspection process. Most of the toxic substances listed above cannot be identified without laboratory testing. If further study or analysis seems prudent, the advice and services of the appropriate specialists are advised.

The following items may exist in this building:

CARBON MONOXIDE

Many of us encounter CO regularly and never know it because it's invisible and odorless. That's why victims of CO poisoning often have no warning that they are in danger... until it's too late. Symptoms include headache, nausea, chronic fatigue, confusion and dizziness. Extreme exposure can even cause a coma or death.

Carbon monoxide is a product of incomplete (poor) combustion. It's a direct and cumulative poison. When combined with blood hemoglobin, CO replaces oxygen in the blood until it completely overcomes the body. Death from CO occurs suddenly. The victim inhaling the toxic concentration of the gas becomes helpless before realizing that danger exists.

According to the American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE) (Ventilation Standard 62- 89), a concentration of no more than 9 parts per million (ppm) (0.0009%), of CO is permissible in residential living spaces. In addition, the Occupational Safety and Health Administration (OSHA) has set an eight-hour work place maximum of 35 ppm. And in flue gas, the Environmental Protection Agency (EPA) and the American Gas Association (AGA) have established the maximum allowable concentration of CO at 400 ppm (See charts).

To ensure safe and efficient combustion, it is imperative that all gas burning appliances be inspected and serviced regularly (once a year) if used in normal service conditions).

Formaldehyde, a colorless gas with a pungent odor, is so commonly used today that virtually everyone is likely to be exposed to at least small amounts of it, and a significant number of people are developing symptoms due to exposure to large amounts of formaldehyde in their homes or workplaces. It was an integral component of the urea formaldehyde foam insulation (UFFI) that was installed in more than five hundred thousand homes in the 1970's. (The use of formaldehyde in insulation was banned by the Consumer Product Safety Commission in 1982, but this ruling was overturned by a federal court in 1983.) In addition, it is present in a large variety of consumer products. It is a major part of the resins used as glue in particle board, plywood, and other pressed wood products used extensively in the construction of homes and furniture. Some cosmetics, paper towels, upholstery, permanent press fabrics, carpets, milk, toilet seats, pesticides, and explosives contain it too. Formaldehyde is also present in the exhaust from combustion appliances and in tobacco smoke.

The most common symptoms of excessive formaldehyde exposure are burning eyes, itching, shortness of breath, tightness in the chest, coughing, headaches, nausea, and asthma attacks. Large amounts of the gas have produced cancer in laboratory animals, and government policy assumes that any substance that can cause cancer in animals may also cause it in humans.

People who live in homes that have been "tightened" for maximum energy conservation are most likely to suffer from the effects of formaldehyde gas. The formaldehyde gas seeps from the walls, furniture, carpet, etc. into the air, building up to high levels in the "tightened" home, which can be irritating, particularly to sensitive people.

To minimize your exposure to formaldehyde, ventilate your home - in good weather, open the windows to provide a constant supply of fresh air. Some methods of heat recovery, such as heat recovery ventilators (also known as air-to-air heat exchangers), are available that can ventilate the home while also conserving energy.

You can seal exposed, raw surfaces of particle board and plywood with oil enamel,

FORMALDEHYDE

ASBESTOS

varnish, wallpaper, or vinyl floor coverings. If you have UFFI insulation, make certain it is completely sealed in the walls or, as a last resort, have it removed.

Page 26

Asbestos is a naturally occurring mineral fiber that has been used in more than 3,000 different construction materials and manufactured products. It is commonly found in heating system insulation, decorative spray-on ceiling treatments, vinyl flooring, cement shake siding and a variety of additional materials. Some asbestos-containing materials were still being installed into the late 1980s.

The asbestos content of different materials varies according to the product and how it is used. Among those materials with higher concentrations of asbestos are insulating products on heating systems and the backing on sheet vinyl flooring. However, an uncontrolled disturbance of any asbestos-containing material in any concentration may be dangerous to your health!

Why is it a problem? Breathing asbestos fibers could kill you. When disturbed, asbestos breaks down into fibers up to 1,200 times thinner than a human hair. When inhaled, they become trapped in lung tissues. Medical research tells us that up to 30 years after inhalation, asbestos fibers can cause lung cancer or mesothelioma, a related terminal cancer of the tissue lining the chest cavity.

Because asbestos is a naturally occurring mineral and has been so widely used in manufactured products, including automobile brake linings, it can be found almost everywhere. Trace amounts are in the air we breathe every day. Most of us have asbestos fibers in our lungs.

On the other hand, there's no known safe level of asbestos exposure. That's why medical, environmental health and regulatory organizations stress the need to protect health by minimizing exposure to airborne asbestos fibers. This is particularly true when asbestos fibers accumulate at elevated levels. Elevated levels result from uncontrolled disturbances and removal of asbestos-containing materials.

How do I know if it's asbestos? Don't guess! Look for asbestos markings on the product or track the product back to its manufacturer or supplier. If these approaches don't work, submit a small sample for laboratory analysis. Cost is minimal. Laboratories are listed in the yellow pages under "Asbestos - Consulting and Testing." Ask a laboratory technician to instruct you how to safely take a sample. If you decide not to check for asbestos in a suspected material, you should assume it contains asbestos and treat it accordingly.

Report: Justin Stobb Address: 17130 26th Avenue SE Page 27

INSULATION

Insulation, weatherstripping, dampers, storm windows, insulated glass and set-back thermostats are features that help reduce heat loss and increase the comfort and thermal efficiency of your home. We examine these items and identify approximate R values for insulation. When appropriate, we offer suggestions for upgrading. Our review of insulation is based upon a random sampling of accessible areas and does not constitute a warranty that all such areas are uniformly insulated or are insulated to current standards.

The following items were inspected:

ATTIC INSULATION

The attic is insulated with blown in wood fiber and fiberglass insulation. The approximate R value of this insulation is 27. This provides good resistance to heat transfer.

WALL INSULATION

The walls are insulated with fiberglass batt insulation. The 2x4 walls suggest that it is 3-1/2" R-11 fiberglass.

FLOOR INSULATION

The floors are insulated with R-19 fiberglass batts. The floor insulation has been properly installed and is in good condition except where noted below.

Several insulation batts are missing and numerous were not properly secured and have falling down. The fallen batts should be reinstalled and secured. The missing batts should be replaced.

Report: Justin Stobb Address: 17130 26th Avenue SE Page 28

STRUCTURE

The structural elements of most residential buildings include a foundation, footings, floor, wall, ceiling and roof framing. The visible portions of these items are examined for proper function, wear, deterioration or signs of non-performance. Some structural components or portions of them are inaccessible because they are buried below grade or hidden behind finished surfaces. Therefore, much of the structural inspection is performed by identifying resultant symptoms of movement, damage and deterioration. Where there are no visible symptoms, components or conditions requiring repair may go undetected and identification will not be possible. We make no representations as to the internal conditions or stabilities of soils, concrete footings and foundations, except as exhibited by their performance.

The following components were inspected:

GENERAL INFORMATION The foundation is constructed from poured in place concrete. A perimeter foundation wall

supports the exterior walls of the building. Interior load bearing components are supported by pier footings and/or continuous spread footings. The floor structure is constructed out of wood joists. The subflooring is plywood. The stud walls are constructed from 2 X 4 dimensional lumber. The exterior wall sheathing is plywood. The roof structure is constructed out of manufactured trusses. The roof sheathing is

plywood.

FOUNDATION The foundation is constructed in a manner typical of buildings of this type and age. There

are minor shrinkage cracks in the foundation. Shrinkage cracks are common in poured concrete foundation walls. They do not affect the performance of the foundation. No

action is indicated.

MUDSILL The mudsill is typically a 2x4 or 2x6 member that is laid flat directly on the top of or cast

into the top of the foundation wall. The mudsill is usually bolted to the foundation wall and serves as a base for the rest of the floor framing. In this building, the mudsill is inaccessible and cannot be evaluated. There was no evidence present that would

suggest that there are defects in this component.

ANCHOR BOLTS Anchor bolts are bolts that are cast into the top of the concrete foundation and retain the

mudsill. The anchor bolts primary function, is to prevent the building from being displaced from its foundation during an earthquake. Anchor bolts have grown in diameter over the years as have the nuts and washers that retain the mudsill. Generally speaking, the newer the building, the better resistance it will have to seismic activity. Anchor bolts

are installed and are performing their intended function.

BEAMS AND POSTS The beams and posts are properly installed and are performing their intended function.

FLOOR JOISTS The visible portions of the floor joists are properly installed and are performing their

intended function.

SUBFLOORING The visible portions of the subfloor are properly installed and are functioning as intended.

WALLS The walls are covered with finished surfaces and therefore were not visible for

inspection. No evidence of defects or deficiencies was observed.

ROOF STRUCTURE The roof structure is constructed from factory-built, engineered trusses. The trusses are

installed in a manner consistent with buildings of this type and are performing their

intended function. No defects or deficiencies were observed.

ROOF SHEATHING The roof sheathing is installed in a manner consistent with buildings of this type and is

performing its intended function. No defects or deficiencies were observed.

CRAWLSPACE

The crawl space is where some of the building's structural elements and portions of its mechanical systems are located. These include foundation, structural framing, electrical, plumbing and heating. The visible portions of accessible systems and components are examined for proper function, excessive or unusual wear and general state of repair. Some items observed in the crawlspace will be discussed under the individual systems to which they belong. It is not unusual to find occasional moisture and dampness in crawl spaces. However, significant and/or frequent water accumulation can adversely affect the building foundation and support system and creates conditions conducive to various types of wood destroying organisms. We check for signs of excessive moisture and water entry. Unfortunately, water entry is often seasonal and therefore evidence may not be present at the time of the inspection.

The following components were inspected:

CRAWLSPACE ACCESS

The crawlspace access is located outside at the rear of the building. The crawlspace was entered and all accessible areas were inspected.

MOISTURE

The soil was damp under the vapor barrier, however, no evidence of water intrusion or standing water problems was observed.

VENTILATION

The crawlspace is adequately ventilated. Vents should be kept unobstructed and clear of leaves and other organic debris. Screens should be maintained to prevent rodent entry.

VAPOR RETARDER

The soil under the house is covered with a polyethylene plastic vapor retarder. This component is typically referred to as a "vapor barrier". While not a true vapor barrier, it does reduce the transmission of water vapor from the soil to the air. The vapor retarder is improperly installed. (see below)

The support post concrete piers are covered with the plastic vapor retarder. This allows the transmission of water vapor from the soil up and into the floor framing. The plastic vapor retarder should be removed from the pier so that it covers at least 85% of the entire surface of the soil only.

PEST CONTROL

Cellulose forms were left in place on the pier footings. This cellulose is conducive to the infestation of various wood destroying organisms. The removal of the cellulose is recommended.

Wood boring insect activity in the Puget Sound area usually does not occur unless there is a ventilation problem inside or underneath the structure, a water leakage/rotting condition in the house or significant quantities of soil to untreated wood contact in a crawlspace or outside around the building exterior. Carpenter ant, termite and wood boring beetle activity is most often a direct result of rot damaged wood and/or excessively moist, humid or damp conditions inside, around or underneath the building. Structural damage from termites and ants in most cases does not extend much past the moisture source and/or rot damaged wood. Eliminating high moisture conditions, improving ventilation, correcting the conditions that are conducive to rotting wood and replacing rot damaged wood will usually eliminate the wood boring insect activity, providing that the building is properly maintained thereafter.

The best way to avoid wood boring insect problems is by preventative maintenance. This includes:

- x Good construction practices which exclude water and prevent high moisture conditions.
- x Removal of wood debris and form wood from the crawlspace and around the building exterior.
- x Maintaining the roof water drain system.
- x Maintaining good yard drainage away from the foundation wall.
- x Avoiding wood-soil contact in the crawlspace or around the house exterior.
- Storing fire wood 6" above grade and in a dry area.

There should be no soil to wood contact in any part of the building exterior or crawlspace, unless that wood is pressure treated. For the greatest safety to permanent structures there should be no soil to wood contact of any kind. Untreated wood in direct contact with exterior flatwork should also be avoided.

Good building practice requires that foundation walls or pier footings supporting wood frame construction, should extend at least 8" above the finish grade with at least a 6" clearance between the top of the soil and the bottom of the wood finish materials. Untreated wood should be raised 1-2" above surrounding flatwork and should have a moisture barrier such as 30 lb. asphalt impregnated felt installed between the concrete and wood. For additional information and treatment options, you should retain the services of a qualified pest control operator.

The crawlspace access door is not rodent proof. The installation of a tight fitting access door is recommended to exclude rodents from the crawlspace.
